

Pediment Bank · 3-Minute Demo Runbook

Snowflake Summit · Pediment Booth · for the recorded video walkthrough of the Pediment Bank dbt Wizard demo. Looped unattended on the booth screen.

3-5 days MANUAL MODEL BUILD TODAY	90 sec DBT WIZARD BUILD	\$11.6M AML EXPOSURE SIZED	16 hr EARLIER THAN RISK COMMITTEE
--	--------------------------------------	---	--

ODI architecture · sources, lakehouse, consumers

Fivetran CDC connectors + event streams (Kafka / Kinesis for HL7, telematics, market data)	Iceberg + Glue Open lakehouse on S3, governed catalog, ACID snapshots, time travel	dbt Labs Bronze → Silver → Gold marts, committed as Iceberg snapshots	dbt Wizard Build-time AI · 90s authoring of governed gold marts	Snowflake + 4 Snowflake, Athena, Trino, DuckDB, Spark — same Parquet, no copies
--	--	--	--	--

One set of files on S3. Five engines read the same Parquet through the Glue catalog. Governed end-to-end: SOC 2 · GLBA · BSA/AML · row-level access · column masking.

DATA ENGINEERS ANCHOR HERE Architecture · Wizard · Live · Pipeline Show the loop, the four sub-agents, the materialization, the connector deep-links. This is your DE proof.	BUSINESS USERS ANCHOR HERE Deposits, Lending, Fraud + AML, Commercial Banking Show the answers, the KPI tiles, the segments, the executive read. The same governed gold layer powers all of it.
---	--

Frame the demo on business outcomes — never functionality

PAIN Chief Risk Officer can't get answers in time for the Risk Committee	REASON Every new question = 3-5 day DE backlog	IMPACT Missed committee, sized exposure, regulator scrutiny	CAPABILITY Build-time AI on the governed gold layer	PROOF Live model build in 90 seconds — on screen
--	---	---	--	---

The mantra: the win is not that dbt Wizard *can* author a model. The win is that the Chief Risk Officer walks into the next Risk Committee with a tested, lineage-tracked answer that did not exist this morning. Every beat below ties to that one sentence.

The 3-minute script · five beats

00:00 – 00:25 Beat 1 · The stakeholder hook

WHAT YOU SAY (25S)

"It is Friday morning at Pediment Bank. The Chief Risk Officer needs to know: Why did SAR-eligible activity in our small-business commercial accounts spike 34% week-over-week in Pacific-Northwest branches? The Risk Committee meets in 16 hours. Today that costs three-to-five days of DE work and a missed meeting."

WHAT YOU SHOW

Open the **Scenario page** (`/scenario`). The Chief Risk Officer's question is the first thing in frame. Let the T-minus counter tick.

OUTCOME → Anchors the audience on a real business question, not a feature.

00:25 – 00:50 Beat 2 · The cost of the gap

WHAT YOU SAY (25S)

"There is no gold-layer mart that answers this. Three days from now the team might land it. The Risk Committee will have already happened. An \$11.6 million AML exposure window that has to be sized before quarter-end — and that is just the dollars we can see."

WHAT YOU SHOW

Stay on Scenario. Highlight the four KPI tiles: 3-5 days, 90s, \$11.6M, T-minus to Risk Committee.

OUTCOME → Quantifies the cost of the gap. Sets up the 90-second proof.

00:50 – 02:20 Beat 3 · The live build (proof moment · DE-anchor)

WHAT YOU SAY (90S)

"We click Run the Build. Four sub-agents — Explorer, Summary, Worker, Verification — open the dbt project, find the right grain, pull a slice of the gold layer, write the new model, write its tests, and materialize it as an Iceberg snapshot. The viewer sees the SQL appear character by character. By the time we are done talking, the model exists, the tests pass, the lineage graph has updated."

Pause once at: "Worker is anchoring the CTE to the grain the Chief Risk Officer asked for — not a notebook-grade approximation."

And again at: "Verification is writing a uniqueness test on the natural key. This is a governed gold asset, not a SQL snippet."

WHAT YOU SHOW

Click into `/wizard-live` . Let the playback run at 1x. The agents type SQL and YAML in real time. The step rail moves Discovery → Schema → Inspection → Model Creation → Tests → Materialization. Terminal-window aesthetic.

OUTCOME → Data engineers see the loop end-to-end. The wow is that the output is a tested, governed asset — not a snippet pasted into Slack.

02:20 – 02:45 Beat 4 • The outcome (P&L tie-back • business-anchor)

WHAT YOU SAY (25S)

"The new mart is materialized. The Risk Committee convenes in 16 hr, not three days. The Chief Risk Officer walks in with the answer: 21 small-business accounts in three coastal MSAs are exhibiting structured-deposit patterns inconsistent with industry NAICS profile — 14 of those share a single ACH counterparty seen in two prior SARs. That is an EDD workflow, not a system-wide rule change. And the next time anyone asks this — wires, cards, peer payments — the model is already there."

WHAT YOU SHOW

Cut to /outcome . Materialized model, tests passed, lineage updated, root-cause panel, impact panel. Then quick scroll through the business-user pages (Deposits, Lending, Fraud + AML, Commercial Banking) so the audience sees the same gold layer powering the executive read.

OUTCOME → Closes the loop from question to action AND shows the business-user surface running on the same data.

02:45 – 03:00 Beat 5 • The architectural ask

WHAT YOU SAY (15S)

"Fivetran lands every source. Iceberg on S3 holds the bytes; the Glue catalog governs the snapshots. dbt Labs builds the marts. dbt Wizard authors the gaps. Snowflake reads the gold layer — and so do Athena, Trino, DuckDB, and Spark. One set of files, five engines. That loop closes for AML signal sizing, fraud loss explanations, deposit-flow anomaly detection, and OCC + FinCEN exam prep — all on the same governed lake. Want to see how this maps to your gold layer? Stop by the Pediment booth or scan the QR."

WHAT YOU SHOW

Final card with the architecture loop, QR code to fivetran.com/contact. Tag dbt Labs co-brand.

OUTCOME → Calls out the architectural pattern. Invites a discovery conversation.

Business outcomes to weave through — never lead with features

OUTCOME THE BUYER FEELS	WHAT IT REPLACES	HOW TO PHRASE IT
Risk Committee gets the answer same-day	3-5 day DE backlog	In time for the meeting, not three days late
\$11.6M exposure sized in 90 seconds	Open gap window	The cost of the gap closed before lunch
Reusable governed mart for every future ask	One-off notebook scripts	The next person who asks gets it for free
CDO does not add headcount to keep up	Hiring DE backfill	Your team stops being the bottleneck
Auditor sees lineage + tests, not a query history	Manual evidence packs	Examiner-ready by default

Anti-patterns • what NOT to say

Don't say: "It runs dbt show against the warehouse and authors a new model file." **Say:** "Ninety seconds from question to materialized answer."

Don't say: "Cortex Analyst." Cortex is intentionally absent from this demo. The story is build-time AI on the governed lake.

Don't say: "dbt Wizard generates SQL." Say: "dbt Wizard authors a governed asset — schema contract, tests, lineage, ownership."

Don't say: "Look at the typing animation." The animation is the texture, not the value.

Don't open with the architecture diagram. Open with the Chief Risk Officer's question. Architecture is the closer.

Don't skip the business pages. After the wizard finishes, scroll through Deposits, Lending, Fraud + AML, Commercial Banking so the audience sees the persona surface that runs on the same gold layer.

Discovery prompts to anchor before the demo

BEFORE YOU PRESS PLAY

- "What questions does your Chief Risk Officer ask that your team cannot answer same-day?"
- "When a stakeholder asks for a new cut of data, what is the average time from ask to merged dbt model?"
- "How many one-off SQL scripts are sitting in someone's Snowflake history that never made it back into the governed layer?"
- "Who is your Economic Buyer for new data investment? Likely audience: CRO, BSA Officer, CDO, Head of Retail Banking."

AFTER THE DEMO LANDS

- "Which of those agent steps — Discovery, Schema, Inspection, Model Creation, Tests, Materialization — is where your team spends the most time today?"
- "If we sized a pilot on three of your highest-value recurring Chief Risk Officer questions, what would success look like in 90 days?"
- "Who needs to be in a 30-minute architecture review to see how this lands on your gold layer? Audience: CRO, BSA Officer, CDO, Head of Retail Banking."

Personas at the booth — split the time

DATA ENGINEER · 60% OF BOOTH TIME

Scenario → Live → Outcome → Architecture → Pipeline

Lead with the question, show the four sub-agents, then walk the architecture (Fivetran + Iceberg/Glue + dbt Labs + dbt Wizard + Snowflake/4 engines) and the Pipeline page with real Fivetran connector deep-links.

BUSINESS USER · 40% OF BOOTH TIME

Deposits, Lending, Fraud + AML, Commercial Banking

After the wizard finishes, drop into the dashboard pages. Show that the same governed gold layer powers the executive read. The build-time AI is invisible to them — they see the answer.

Required follow-up materials

- One-pager · Pediment Bank · at fivetran-jasonchletsos.github.io/Fivetran-Demo-Repository/one-pager/banking/
- Live demo URL · fivetran-jasonchletsos.github.io/Banking-ODI-Demo/
- 3-minute walkthrough video (this recording)
- Architecture diagram on the Architecture tab of the demo
- Cross-industry credibility · Pediment Bank

Booth-floor reminder: the demo is built to run unattended on the booth screen. If a prospect walks up mid-playback, do not restart. Pick up the narration where the playback is — that is also the point. The build finishes

whether someone is watching or not. That is the entire pitch.

POWERED BY FIVETRAN + DBT LABS · OPEN DATA INFRASTRUCTURE · PEDIMENT BANK IS A FICTIONAL DEMO
ENTITY · GENERATED 2026-05-24

The gold layer gets acted on, not just queried

Activations is the fourth native NewCo stage, right after Transformations. The instant gold.fct_structured_deposit_alerts flags an account whose composite structuring_score crosses 0.85 on an ACH counterparty already tied to a prior SAR filing, Activations pushes the case straight into NICE Actimize Case Manager — no CSV export, no manual re-keying, no second source of truth.

TRIGGER

0.85

structuring_score threshold, prior-SAR counterparty

DESTINATION

NICE Actimize

Investigation_Case · insert

CASES OPENED

5 in 12s

vs. 4–6 hrs manual re-key

GOLD COLUMN		ACTIMIZE FIELD
account_id	→	Party_ID
structuring_score	→	Risk_Score
ach_counterparty_id	→	Related_Entity_ID
branch_region	→	Business_Unit
prior_sar_reference	→	Linked_SAR_Number

WHAT YOU SAY

"The mart is materialized — but a tested gold table sitting in Snowflake is still not a case. Today the BSA team exports this exact query to CSV and keys it into Actimize by hand: four to six hours per batch, racing a 30-day SAR filing clock on \$11.6 million of exposure."

WHAT YOU SHOW

Architecture page → Activations panel, right after the dbt-wizard section. Trigger / Destination / Outcome tiles on screen.

WHAT YOU SAY

"Watch what happens next. The moment dbt commits structured_deposit_alerts, Activations picks it up — no export, no CSV. The 21 flagged accounts, the shared ACH counterparty, the two prior SAR references — all of it syncs straight into Actimize Case Manager as five new investigation cases, each pre-populated with the party ID, the risk score, and the linked SAR number."

WHAT YOU SHOW

/activations-live: Segment Definition → Field Mapping → Sync Preview → API Push. Field-mapping table visible, no code.

WHAT YOU SAY

"The analyst opens Actimize to work the case, not build it. That's the fourth stop after Connections, Destinations, and Transformations — Activations turns the governed answer into the system where the investigator already lives."

WHAT YOU SHOW

/activations-live → Destination Confirmation table. Status line: "5 records synced to NICE Actimize — 12s ago."

Gold-layer pattern: 21 flagged accounts sharing 14 ACH counterparties, two of those counterparties already carrying a prior SAR reference — the same structuring pattern the dbt-wizard mart in this demo just built and sized at \$11.6M. Closing the CSV-to-Actimize gap protects the 30-day SAR filing clock on that exposure window. Synthetic data — not a real bank, not a real case.
